The C++ programming language was developed by Bjarne Stroustrup in 1979. It was originally named as 'C with Classes'. It is an enhancement of the C programming language and is widely used for designing various softwares that consist of large and complex software applications. The popularity of this programming language is attributed to the fact that it is simple and easy to learn and yet powerful and flexible enough to write complex codes for any operating system, be it a Microsoft Windows or a UNIX operating system. The C++ programming language is based on the C programming language. The major difference between them is that 'C with classes' allows users to write programs using objects. Objects are basically the instances of classes. The data structures are also different, as one can use both built-in and user-defined types of data structures in C++ programming language unlike C programming language where user defined types of data structures are not allowed. Although both these languages are case sensitive, the operators used in them are different. For example, '+' for addition in C is '+=' in C++ programming language. C with classes is a superset of C and hence all the constructs and features of C programming language are available in this programming language. So, if one knows the basics of C programming language, it becomes easy to learn the concepts of C++ programming language. A user does not need to learn everything from scratch, instead he can start by learning new constructs and features with the help of 'overloaded' operators. However, there are some differences between these two languages which must be kept in mind to avoid errors while writing codes in C++ programming language. Some differences are discussed below.
